username.domain.com, domain.com/**username** or **username**@domain.com).

The editable blocklist can be found in list_raw.txt and is categorized into six sections:

- **Privileges** User privilege terms to prevent faked authority. Example: *root*, *super*
- **Code**: Programming terms that you might want to avoid in a url. Example: *void*, *null*
- **Terms**: Various technical terms. Example: *request*, *system*
- **Financial**: This is for the spammers/scammers. Example: *payment*, *invoice*
- **Sections**: Common website pages and sections. Example: *faq*, *help*
- **Actions**: User actions. Example: *delete*, *create*

You can try the blocklist using the tool Username checker.

Please note that this list does not contain any curse words, there are other lists for that.

How it works

This repro contains standard data files, just pick the format of your choosing.

- newline: list.txt
- json: list.json
- python: list.py
- javascript (es6): list.js
- javascript (commonjs): list-commonjs.js
- php: list.php
- yaml: list.yaml

Packages

Blocklist has been ported to different languages.

Official

- python
- node

Third party libraries containing data from blocklist

- the_big_username_blacklist (ruby)
- the-big-username-blacklist (elixir)
- username-blocklist (rust)
- django-username-tools (python/django)

Contributing

Want to contribute? Awesome.

- Checkout the origin/develop branch
- First edit `list_raw.txt`
- When you are done, run `python scripts/generate.py`.
- ... This script will update the various list files.
- Done? Send a pull request.

Release start

These hooks will automatically bump the application version when using `git flow release ...`

```
chmod +x $PWD/git-hooks/bump-version.sh
ln -nfs $PWD/git-hooks/bump-version.sh .git/hc
ln -nfs $PWD/git-hooks/bump-version.sh .git/hc
```

Git workflow and release management

This project uses gitflow and semantic versioning.
